

## ZADATAK

Napravite jednostavnu WindowsForms aplikaciju koja omogućava:

- Prikaz filtriranog popisa proizvoda (**Products**). Uz pomoć LINQ projekcije dohvatiti i prikazati samo one attribute koji su vidljivi na ekranu, te sortirati po **ProductName** atributu.
- Filtriranje popisa proizvoda se provodi odabirom dobavljača (**Supplier**) i kategorije proizvoda (**Category**) iz popisa prikazanih na zasebnim formama.

**Zadatak treba riješiti upotrebom Entity Framework-a i LINQ-a.**

The screenshot shows three windows from a Windows Forms application. The 'Products' window has a 'Product filter' section with 'SupplierID' set to 5 and 'CategoryID' set to 4, and a 'Display products' button. Below it is a 'Product list' table showing two products: 'Queso Cabrales' and 'Queso Manchego'. The 'Choose supplier' window shows a list of suppliers with 'Cooperativa de Q...' selected. The 'Choose category' window shows a list of categories with 'Dairy Products' selected. Red arrows indicate the flow of data from the selection windows to the 'Products' window.

NORTHWIND

Podaci se nalaze u tablicama **Categories**, **Products**, i **Suppliers** u bazi podataka **NORTHWIND** na **PI Serveru (31.147.204.119\PISERVER,1433)**. Podaci za spajanje su `user id=student;password=student`
